A FREE GUIDE FROM LAYLA AL-DORANI

What to Eat in Your 40s

An evidence informed, plant forward guide to eating for energy, strength, and long term health.

WHERE TO BEGIN

Your 40s are a turning point, not a problem to fix.

Somewhere in this decade, the body quietly changes the rules. Muscle is a little harder to hold onto. Metabolism shifts. Blood sugar and cholesterol can begin to drift. Bone density starts its slow decline, and for many women perimenopause is already underway.

None of this is cause for panic. It is simply new information about what your body needs more of now. And food is one of the most powerful levers you have, with changes that are mostly additions, not restrictions.

This guide covers the five things that matter most in midlife, protein, fiber, steady blood sugar, gut health, and bone and heart health, and then shows you how to put them on a plate without counting a thing.

01

PROTEIN

Eat more than you think.

Why it matters now. From around 40, we gradually lose muscle, a process called sarcopenia. Muscle is what keeps you strong, steady, and metabolically healthy as you age. Protein, paired with regular movement, is how you protect it.

HOW MUCH

Aim for protein at every meal, roughly a palm sized portion, spread across the day rather than saved for dinner. Many women in midlife fall short, especially at breakfast, which is the easiest meal to fix.

WHERE TO GET IT, PLANT FORWARD

Lentils, chickpeas, beans, tofu, tempeh, edamame, seitan, nuts, seeds, and whole grains.

Eating a range of legumes, grains, nuts and seeds across the day gives you the full set of amino acids your muscles need. You do not have to combine them at a single meal.

> ONE HABIT TO START
>
> Anchor every meal with its protein first, then build the rest of the plate around it.

02

FIBER

The nutrient almost everyone misses.

Why it matters. Fiber feeds the healthy bacteria in your gut, steadies blood sugar, helps lower cholesterol, and keeps you full and regular. Most adults get only about half of what they need.

WORK TOWARD

Around 25 to 30 grams a day or more. Increase it slowly and drink water alongside, so your gut has time to adjust comfortably.

WHERE IT LIVES

Vegetables, fruit, legumes, whole grains, nuts, and seeds. Animal foods contain none, which is one reason a plant forward plate is naturally higher in it.

> **THE DIVERSITY RULE**
>
> Aim for thirty different plants across the week. Variety, not just quantity, is what a healthy gut thrives on. Herbs, spices, nuts and seeds all count.

03

STEADY BLOOD SUGAR

Energy without the crash.

Why it matters. In midlife, blood sugar and insulin become a little less forgiving. Keeping them steady means steadier energy, mood, and appetite through the day, and lower risk over the long term.

This is not about cutting carbohydrates. It is about how you build the plate, so the rise after eating is gentle rather than sharp.

PRACTICAL MOVES

Pair carbohydrates with protein, fiber, and a little healthy fat. Start meals with vegetables or protein. Choose whole grains over refined ones. Keep sugary drinks occasional, and take a short walk after a meal, it helps more than you would expect.

> **THE SIMPLEST VERSION**
>
> Never eat a carbohydrate naked. Give it a companion, some beans, tofu, nuts, or vegetables, and it treats your body more kindly.

04

GUT HEALTH

The foundation under everything.

Why it matters. Your gut shapes digestion, immunity, mood, and how well you handle food. A diverse microbiome, fed on a wide range of plants, is what you are aiming for.

WHAT HELPS

A wide variety of plants, fermented foods such as unsweetened yogurt or plant yogurt, kimchi, sauerkraut, and miso, and fewer heavily processed foods overall.

GO GENTLY

Add fiber and fermented foods gradually. A gut that is not used to them needs a little time, and a slow build is far more comfortable than a sudden overhaul.

> **REMEMBER**
>
> You are not feeding only yourself. Every plant you eat feeds the bacteria that do so much quiet work on your behalf.

05

BONE AND HEART

Investing in the decades ahead.

BONE

Bone density starts to decline in midlife and faster around menopause. Protect it with enough protein, calcium from leafy greens, tofu set with calcium, fortified plant milks and tahini, vitamin D from sunlight and a supplement if your doctor advises one, and regular weight bearing movement.

HEART

The same plant forward pattern, rich in fiber, legumes, nuts, olive oil, and vegetables, is one of the best studied ways to protect your heart for the years to come. What is good for your gut and your blood sugar is quietly good for your heart too.

> **THE REASSURING PART**
>
> These are not five separate diets. The same plant forward, protein aware, fiber rich way of eating supports all of it at once.

PUTTING IT TOGETHER

A day on a plate.

No counting, no rules. Most of the plate is plants, every meal has protein and fiber, and nothing is off limits.

Breakfast	Something with protein and fiber, not just carbohydrate. A tofu scramble with greens, or oats with soy milk, seeds, and berries.
Lunch	Build a bowl. Half vegetables, a quarter protein such as lentils or tofu, a quarter whole grains, finished with olive oil or tahini.
Dinner	The same shape, warm. A lentil or chickpea stew, plenty of vegetables, and a whole grain.
Snacks	Fruit with a handful of nuts, hummus with vegetables, or yogurt with seeds.

> THE WHOLE PLAN, IN ONE LINE
>
> Protein at every meal. Thirty plants a week. Whole over refined. Plants at the center, most of the time.

THE MINDSET

Pattern over perfection.

You do not need a perfect diet. You need a good pattern, most of the time. Plant forward does not mean all or nothing. It means plants at the center, built up meal by meal, with room for real life.

Consistency is what pays off over the years, not any single perfect week. The women who feel strongest in their fifties and sixties are rarely the strictest. They are the most consistent.

So start with one change this week. Protein at breakfast. One more plant at lunch. A walk after dinner. Small, repeatable, and real beats ambitious and abandoned, every time.

FROM LAYLA

This is the way I cook, and feed my own family.

Food is not meant to be a source of anxiety. It is meant to nourish you and bring people around a table. Everything in this guide is simple on purpose, because the changes that last are the ones that fit into a real life.

If this was useful, there is more where it came from, including TWIST, my plant forward Qatari cookbook.
